I have a question for you, which is not answered on your website page <https://www.smartme.co.uk/roll-out>

**Roll-out rules and progress of Smart Meters in the UK**

How is the Smart Meter roll-out progressing? What are the government commitments and subsequent rules? How many Smart Meters are working?

[www.smartme.co.uk](http://www.smartme.co.uk)

**What is the evidence that smart meters are safe and have no adverse health effects?**

You say that all providers must use smart meters, as traditional meters are no longer available, but what I notice that most websites are not telling people is that these machines emit radiofrequency radiation. Telling customers, they can get better tariffs, free energy, or saving money is only part of the reality, but what about the evidence that these machines are safe and have no adverse health effects on humans, and animals?

It's extremely immoral to not tell people the truth about these machines and if you want 52 million UK households to have these machines, then the industry must have the long-term safety studies to show that they cause no long-term health effects?

I predict that this email will be ignored and deleted because there is no evidence that smart meters are safe. Human beings are the guinea pigs and it's extremely concerning, because every household that has these meters is being affected, whether they know it or not.

Therefore, in my own opinion, smart meters are being used to weaken human beings into compliance, and they are surveillance weapons as part of the smart grid.

Kind regards [REDACTED]
